                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 10, Application US/09978249
Patent No. US2002010678041
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICART: Fiscella, et al.
TITLE OF INVENTION: Extracellular Matrix Polynucleotides, Polypeptides, and Antibodie
TITLE OF INVENTION WHABER: US/09/978,249
CURRENT APPLICATION NUMBER: US/09/978,249
PRIOR APPLICATION NUMBER: 60/198,123
PRIOR FILING DATE: 2001-04-11
PRIOR FILING DATE: 2000-04-18
NUMBER OF SEQ ID NOS: 16
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 10

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

An assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis comprising detecting an isomerized or optically inverted protein in a sample.

The invention relates to an assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted fragments from proteins such as perlecan, biglycan, decornin, fibrillin-1 or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the gandjusdide GM2 activator, calgaranlin B or asposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and parkinson's diseases, amyotrophic lateral sclerosis, theumatof polyarthritis and lupus expinematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed
be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GEARLVSEDPINDGEWHRVTALREGRRGSIQVDGEELVSGRSPGPNVAVNAKGSVYIGGA 230
genes. (1) is useful in gene therapy techniques to restore normal activity of [11] or to treat disease states involving [11]. (11] is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (11) and its binding partners are useful in medical imaging of sites expressing [11]. (1) and [11] are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymouteotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                          and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 CERQPCQHGATCMPAGEYEFQCLCRDGPKGDLCEHEENPCQLREPCLHGGTCQGTRCLCL 60

The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymuleotide sequence belonging to the perfecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GW2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a capturelative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

The present invention relates to the isolation of novel human polypeptides referred to as NOVX (NOVI-NOV4), variants of these proteins, and the polynucleotide sequences encoding them. The NOVI proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for reating a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABUS2111-ABUS2408 represent the human NOVX proteins of the invention

The present invention relates to the isolation of novel human uterine motility-association polypeptides, and cDNA (AAS28936-AAS28994) and genomic sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and amourt, and menstrual disorders. The polymucleotide sequences of the invention are also useful in gene therapy. AAD18094-AAD18152 represent novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  90 DAP----GOYGAYFHDDGFLAFPGHVFSRSLPEVPETIELEVRISTASGLLLWQGVEVGE 145

Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia.

Claim 11; SEQ ID NO 252; 601pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a late also be used in alleviating symptoms associated with the disorders and in diagnostic indiagnostic symptoms associated with the disorders and in diagnostic immunosespape e.g. radioimmunoassays or enzyme linked immunoserbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebral schaemia, angiogenesis, necroplasms of the breast or liver, cardiovascular disorders e.g. corneal infection, nervous system disorders e.g. Altheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, can also be used to aid wound healing and epithelial cell proliferation, cransplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotrais. The polypeptides can also be used cornears at foot additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, miterals, cofactors and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note: The

These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention

01-SEP-
                                                                                                                                                                              RESULT 10
                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of novel human calciumbidding proteins, and cDNA (AAA31577-AAA31654) and genomic sequences of encoding for these proteins. The sequences of the invention are useful in the diagnosis, prevention and/or prognosis of diseases associated with aberrant calcium flux. Such disorders include neurological diseases (e.g. amylotrophic lateral sclerosis, ALS), immune dysfunction (e.g. severe combined immunodeficiency, SCID), digestive disorders (e.g. irritable bowel syndrome, IBS), neoplastic disease (e.g. cancer), blood disorders (e.g. haemophilia), and/or infectious disease (e.g. acquired immunodeficiency syndrome, AIDS). The novel calcium-binding proteins are also useful as screening tools to identify antagonists and/or agonists that may enhance or inhibit activities mediated by calcium-binding proteins. The polynucleotides of the invention are also useful in gene therapy. AAU19952-AAU19969 represent the novel human calcium-binding the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid molecule encoding a calcium-binding protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         34 EHEENPCQLREPCLHGGTC----QGTRCLCLPGFSGPRCQQGSGHGIAESDWHLEGSGGN 89

                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polypeptide comprising a sequence at least 90% identical to a full length protein sequence selected from 55 sequences given in the specification sequence selected from 55 sequences given in the specification, or the encoding sequence of 163, 74 or 140 amino acids fully defined in the specification, or the encoding sequence or HTMSMO1. The protein and its encoding nucleic acid are useful for the appropriate and its encoding nucleic acid are useful for diagnosing a pathological condition in a subject and for preventing, treating or ameliorating a medical condition. The protein its encoding nucleic acid and an isolated antibody that can bind to the protein are useful in treating, preventing, diagnosing and/or prognosing immunodeficiencies, autoinmune disorders, allergic reactions and conditions, inflammatory conditions, graft-versus-host disease, blood-related disorders, hyperproliferative disorders, neurological disorders, endocrine disorders, reproductive system disorders, and/or diagnose neuronal disorders. The protein of the invention is useful to stimulate neuronal gisorders and/or diagnose neuronal damage which occurs in certain characteristics such as body height, weight, hair color, and to increase or decrase storage capabilities, fat content, lipid, protein, or decrase storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors or other nutritional components. The mucleic acid of the invention can be used in gene therapy. This sequence represents a novel human protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  34 EHEENPCQLREPCLHGGTC---QGTRCLCLPGPSGPRCQQGSGHGIAESDWHLEGSGGN 89

The invention relates to novel genes (ABV83682-ABV84101) and proteins (ABP66710-ABP67129) useful for preventing, treating or ameliorating isolated aconditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast gastrointestinal tract, liver, lung, or urogenital; (b) immune hasenia, autoimmune thyroiditis, diabetes mellitus, Crobn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy, and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               90 DAP----GQYGAYFHDDGFLAFPGHVFSRSLPEVPETIELEVRISTASGLLLWQGVEVGE 145

C. The invention relates to novel isolated polynuclectides (I) encoding extracellular matrix (ECM) polypeptides. (I) and a polypeptide encoded by (I) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the polypeptides can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays [ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. rheumatoid arthritis hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, virtuses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound be aling and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell collypeptides can also be used as a food additive or preservative to increase storage capabilities. The presents the amino acid sequence of novel human extracellular matrix
                                                                                                                                                                                                                                                                                                                           antiproliferative; cardiant; vasotropic; cerebroprotective; nootropic; neucoprotective; antibacterial; virucide; fungicide; ophthalmological; extracellular matrix; ECM; autoimmune disease; rheumatoid arthritis; hyperproliferative disorder; neoplasm; cardiovascular disorder; hyperproliferative disorder; neoplasm; cardiovascular disorder; cardiat; cerebral ischaemia; infection; nervous system disorder; Albhelmer's disease; ocular disorder; sunburn; wound healing; food additive.
                                                                                                                                                                                                                                                                                                          Human; immunosuppressive; antiarthritic; antirheumatic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acids encoding extracellular matrix polypeptides, for diagnosing, treating, preventing or ameliorating human disorders ar disease, such as, autoimmune, hyperproliferative or cardiovascular
                                                                                                                                                                                                                                                               Novel human extracellular matrix (ECM) protein #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fiscella M, Shi Y, Ebner R, Ruben SM;

                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human uterine motility association polypeptides, and cDNA (MAS28936-AAS28994) and motility association polypeptides, and cDNA (MAS28996-AAS28994) and enough the sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polymucleotide sequences of the invention are also useful in gene therapy, AAU18094-AAU18152 represent novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at [ftp.wipo.int/pub/published_pct_sequences]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecules encoding 49 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 21.9%; Score 343; DB 4; Length 432; Best Local Similarity 33.5%; Pred. Novel polypeptides and polynucleotides useful as diagnostic reagents the diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia.

Claim 11; SEQ ID NO 179; 601pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or amaliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ILISA). Disorders which are diagnosed or treated include autoimmune classes e.g. rheumatcid arthitis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. crebrish is stocked by netrous system disorders e.g. Alzheimer's disease, infections caused by becteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, for supporting cell culture of primary tissues, to resentate tissues and in chemotrasis. The polypeptides can also be used diditive or preservative to increase or decrease storage as food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, ocfactors and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note: The

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastroincestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21.9%; Score 343; DB 4; Length 432;

TISOID SPECIFICITY: Embryonic inervous system and muscle.
TISOID SPECIFICITY: Embryonic inervous system and muscle.
DEVELOPMENTAL STAGE: More abundant early in development.
DINKE Contains heparan sulfate chains as well as N-linked and O-linked oilgoasccharides (By similarity).
SIMILARITY: Contains 9 Kazal-like domains.
SIMILARITY: Contains 2 laminin EGF-like domains.
SIMILARITY: Contains 1 SEA domain.
SIMILARITY: Contains 3 laminin G-like domains.

-!- PTM: Contains heparan sulfate chains as well as N-linked and O-linked oligoaccharides (By similarity).
-!- SIMILARITY: Contains 9 Kazal-like domains.
-!- SIMILARITY: Contains 9 Kazal-like domains.
-!- SIMILARITY: Contains 1 SEA-like domains.
-!- SIMILARITY: Contains 1 SEA domain.
-!- SIMILARITY: Contains 3 laminin G-like domains.

                                                                                                                                                           -1- FUNCTION: Probable role in myofilament assembly and/or attachment of the myofilament lattice to the cell membrane. May be an extracellular anchor for integrin receptors in muscle.
-1- SUBGELLULAR LOCATION: Extracellular matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Note=No experimental confirmation available;
--- TISSUE SPECIFICITY: Found in the basement membrane of all contractile tissues. It is concentrated over muscle dense bodies and M-lines which are associated with beta-integrin.
--- IDVELOPMENTAL STRABE: Synthesized early in embryogenesis.
--- SIMILARITY: Contains 3 LDL-receptor class A domains.
--- SIMILARITY: Contains 16 immunoglobulin-like C2-type domains.
--- SIMILARITY: Contains 3 laminin G9F-like domains.
--- SIMILARITY: Contains 3 laminin G1-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                             Percy C.M., Baynes C.;
Submitted (MAR-1997) to the EMBL/GenBank/DDBJ databases.
